

# Science

From the early years, children are provided with the opportunities for discovery and experimentation through first hand experience. They are encouraged to observe, discuss, classify, compare, set up fair tests and record and interpret their findings. Through their investigations children are given the opportunity to learn about plants, animals, materials, seasons, rocks, light, forces, magnets, habitats, evolution and inheritance, states of matter, Earth and space, electricity and sound. Activities will take place in the context of specific science focus lessons and across our topic themes.

Our aim is to nurture the enquiring mind and extend children's knowledge and understanding of the world around them.
